[EUROCAT Register (version 2.0)]. We describe the EUROCAT Registry, an ongoing multicentric epidemiological study in European children. It has been performed within the framework of the European Committee for Etiologic Research in Children's Environment and Health (ECERCH), which was founded in 1996. In 2002, 28 Registries of Infants and Children from the 22 countries of the European Union, Switzerland, Iceland and Norway, which fulfilled the requirements, took part in the EUROCAT Registry. The member countries were asked to transfer to a central database information on a specified number of cases recorded in the Registry. The ascertainment of diagnoses relied mainly on hospital discharge and death certificates, complemented by records from general practitioners and police. The variables registered are: diagnosis (International Classification of Diseases, ICD, version 9 [ICD9] and revision 10 [ICD10]), date of the hospital admission or death, main and contributory causes of death, sex, and age at admission or death. The annual ascertainment is 100,000 admissions of children aged 0-14 years for population rates and 200,000 for selected samples such as cases of malignancies, children with congenital anomalies, newborns and children admitted to intensive care units. The study was fully computerized and the data were transferred to a central database. The cases were selected according to a detailed protocol. In order to ensure the validity and completeness of the data, the Registry was supervised by a data quality assurance team and a central management team. The quality of data has been confirmed by comparison with data from hospital records and by comparison of data from the Registry with the records of the compulsory notification of congenital anomalies. The EUROCAT Registry (version 2.0) allows comparison of congenital anomalies in different populations and different geographical areas. It will be of great importance for the evaluation of risk factors and for preventive measures.Q: Test.objects not django.test.TestCase? Why does django.test.TestCase extend django.test.TestCase?
